

Legend

Initial source inventory. The refreshed NBER Working Paper 11765 text exposes Remarks 1–3, Definition 4, Lemmas 5–6, and Theorems 7–8. This DAG intentionally keeps implementation certificate layers out of the main graph. The detailed Lean endpoints, finite schedule wrappers, and no-overshoot review interfaces are recorded in the README, PaperInterface, post-paper audit report, and Theorem 8 source proof plan.

Current Theorem 8 boundary. The finite payoff algebra, threshold strategy behavior, terminal-record formulas, completed-rank and all-rank no-overshoot endpoints, shifted continuation-threshold bridge, and source-completion certificate plumbing compile. The finite exact-record state-game route now has complete displayed-schedule and canonical price-sorted direct-PBE endpoints, ordinary and belief-explicit, with displayed slot/payment formulas and ordered payoff packages. The full paper theorem remains conditional until the real generalized-English source game supplies the arbitrary-history generation and PBE identification needed to remove the remaining source-completion boundary.
