

**Paper:** [Paper Title]  
**Authors:** [Authors]  
**Publication venue:** [Publication Venue]  
**Year:** [Year]  
**Formalized PDF:** [FormalizedPDFlink]

Replace these scaffold nodes with the paper’s named definitions, lemmas, propositions, theorems, and corollaries. Keep nodes on the grid below: columns are spaced by 6.4cm and rows by 3.2cm, which is wide enough for the default 5cm node text widths. Prefer straight or orthogonal arrows (‘–’, ‘—’, ‘-—’) and route through empty grid cells when a dependency skips a row. Draw from prerequisite to dependent result so the arrowhead points at the consumer. For short horizontal gaps, use explicit anchors like ‘(A.east) – (B.west)’ and increase spacing if the arrowhead visually merges with a node. After every layout change, render and inspect the PDF; if anything overlaps, increase row or column spacing before adding complicated curves. Once the initial named-result map is complete, prefer README-status style updates over adding new boxes or arrows.
